The HR

Cognizant Technology Solutions India Pvt. Ltd.**Subject: - Request for Issuance of NOC for Internship at Cognizant Technology Solutions.**

Yeshwantrao Chavan College of Engineering (YCCE) having permanent AICTE ID 1-4736951 established in 1984, is the flagship Engineering Institute of **Meghe Group of Institutions (MGI)**, a well-known name in the field of Education in Central India creating Mind Share and Human Capital to cater to the requirements of nation building.

In the recently declared "**National Institute Ranking Framework**" (NIRF) by the Ministry of HRD Government of India for the top Institutes under type A category which included IITs, NITs, Government Colleges, Private and Autonomous colleges YCCE is ranked in TOP 150. **YCCE has been accredited by NAAC with Grade "A++".**

As our endeavor to continuously upgrade the technical skills of our students we are very much thankful to you for allowing our student/s (as per the communication with department of Computer Science and Engineering) to undergo **Four-month Internship** in **Cognizant** as per the agreed norms, for a period as mentioned below:

Sr. No.	Name of Intern Students	Semester/Year	Engineering Branch
1	Mr. Adarsh Kishor Satpute	8th Semester / 4th Year	B.Tech – Computer Science and Engineering

Duration of Internship : From 24-02-2026 to 16-06-2026

Kindly allow the candidate to give presentations based on internship work, as it is a part of evaluation. You will have to share the month wise feedback of students. Hope your positive response towards the same. Thanking you

Date: 29-04-2026

Undertaking by Student

This **Semester Long Internship** is a part of my B. E. VIIIth Semester degree course curriculum under which I will be evaluated. I have completely read the attached guidelines of Semester Long Internship. During the entire period, from Date 24-02-2026 to date 16-06-2026 of **Semester Long Internship**, I, **Adarsh Kishor Satpute** shall strictly abide by the rules and regulations, safety guidelines, of **Cognizant Technology Solutions India Pvt. Ltd.**, failing which my Internship shall be terminated with immediate effect. In addition to this, I will follow the COVID-19 norms, from the date of reporting at industry. Yeshwantrao Chavan College of Engineering Nagpur or **Cognizant Technology Solutions India Pvt. Ltd.** will not be responsible in case of mishap/eventualities happen.

I am aware that the Evaluation Report is to be submitted to the Faculty Mentor / Guide with the consent of Industry persons/Trainers. This evaluation report along with TWO Internship Presentations carries a total 100 marks which will be clubbed with ER of 2 credits in my SoE of 8th semester.

STUDENT'S DIARY/ LOG

Your Name: Adarsh Kishor Satpute

Your Institute: Yeshwantrao Chavan College of Engineering

Company where internships are carried out: Cognizant Technology Solutions India Pvt. Ltd.

Period : 2 weeks From : 24-02-2026 To : 09-03-2026

Week: 1-2		Date:	From : 24-02-2026 To : 09-03-2026
Dept./Division	GenC ADM	Name of Project	Bootcamp & Sprint 0 Refresher
Name of Supervisor With e-mail id		Mrs. Maria Ashwini Email: maria.ashwini@cognizant.com	
Main points of the week		Bootcamp, Induction, Cognizant Culture & Sprint 0 Refresher (HTML5, CSS3, JavaScript, MySQL, Core Java)	
Between 24th February and 4th March 2026, the program began with the Cognizant GenC Bootcamp and Induction phase. Sessions covered Cognizant's vision, mission, core values, code of conduct, and the GenC Programmer Analyst Trainee role. Mandatory e-learning modules on Information Security, Data Privacy, Responsible AI, and Secure Coding were completed. ID issuance, system provisioning, GenC Learn platform onboarding, and account creation were finalized. The Behavioural (BH) Pre-Assessment, Email Etiquette, and Group Discussion modules were also initiated during this phase. From 5th to 9th March 2026, technical training commenced with Sprint 0 Refresher activities on the GenC Learn platform. Self-paced modules and instructor-led sessions covered HTML5, CSS3, and JavaScript fundamentals (DOM, ES6 features, async/await), ANSI SQL with MySQL (queries, joins, subqueries, stored procedures), and Application Programming with Java up to version 25 (OOP, collections, streams, exception handling, JDBC). The Generative AI module — AI Accelerate — and Responsible AI deep-dive sessions were also completed during this period.

Department of Computer Science and Engineering

• If this is your first fortnight in the company, please write a paragraph (or two) on this company, covering all the relevant information that YOU think will be of use / value to you during your sabbatical. You may add pieces of company information in your subsequent reports.

Cognizant Technology Solutions India Pvt. Ltd. is the Indian arm of Cognizant Technology Solutions Corporation, a NASDAQ-100 listed multinational professional services and technology company headquartered in Teaneck, New Jersey, USA. Founded in 1994 as a technology unit of Dun & Bradstreet, Cognizant operates across more than 35 countries with a workforce of approximately 350,000 professionals globally. India is its largest delivery footprint, with major centres in Chennai (its largest), Bangalore, Hyderabad, Pune, Mumbai, Kolkata, Coimbatore, Gurgaon, and Noida. I have been allocated to the ADM (Application Development & Maintenance) Practice within the Java Full Stack React track.

From a practical standpoint during this sabbatical, several aspects are particularly relevant. Cognizant's GenC program is a transformative campus-to-corporate initiative that immerses fresh graduates in agile, delivery-focused training through the DevLed Skilling methodology. Sprint cycles, agile ceremonies, capstone Integrated Development Projects, and continuous BU SME evaluations mirror exactly how live client engagements operate. The company emphasises certifications, continuous learning through internal platforms, and Responsible AI usage — all of which directly shape the day-to-day learning culture I will be operating in for the next five months.

• **Who did you interact with in this period? Which depts. did you visit / work in?**

I primarily interacted with my batch trainer Mr. Vinod Krishnaswamy and the GenC Onboarding team at Cognizant Chennai. I attended virtual leadership-connect sessions with Cognizant ADM Practice leaders, and collaborated with batchmates within the Java FSE React PoD during refresher exercises.

• **List down (maximum) three activities carried out by you in this period. Describe each one briefly.**

Activity 1 — GenC Onboarding & Cognizant Culture Sessions (Days 1–4)

Attended structured induction sessions covering Cognizant's history, business units, service lines, and the GenC program lifecycle. Completed mandatory e-learning on Information Security, Data Privacy, Responsible AI, and Secure Coding. The sessions reinforced Cognizant's customer-centric values and the standards expected of a Programmer Analyst Trainee.

Activity 2 — Behavioural Pre-Assessment, Email Etiquette & Group Discussion (Days 5–7)

Completed the BH Pre-Assessment to benchmark communication and behavioural competencies. The Email Etiquette session covered structured business email writing, subject line discipline, and tone. The Group Discussion

(Accredited 'A' Grade by NAAC)

Hingna Road, Wanadongri, Nagpur - 441 110

Ph.: 07104-242919, 242623, Fax: 07104-242376, Website: www.ycce.edu

E-mail : principal@ycce.edu, info@ycce.edu

Department of Computer Science and Engineering

module placed each participant in a 6-person discussion on a current technology topic, with structured peer feedback.

Activity 3 — Sprint 0 Refresher: Java, MySQL & JavaScript (Days 8–11)

Worked through self-paced modules and hands-on exercises on the GenC Learn platform — Core Java OOP and collections, MySQL joins and stored procedures, and JavaScript ES6 + async patterns. A short integrative exercise required reading data from MySQL via JDBC and rendering it in a small HTML/JS page.

• **What problems did you face and what did you do to address them? What was the learning that resulted from each of them?**

1. Information overload during induction The volume of policies, mandatory e-learning, and platform setup in the first three days was significant. I addressed this by maintaining a daily action checklist mapped to the GenC Learn calendar. The learning was that structured note-taking and a personal task tracker are essential survival tools in a corporate onboarding environment.

2. Bridging college Java to industry-grade Java My college Java knowledge was syntactically strong but stopped at Java 8. Java 21 features such as records, sealed classes, and virtual threads were unfamiliar. I worked through the GenC Learn modules and ran each example locally in IntelliJ IDEA to internalise the differences. The learning: industry Java is a moving target — staying current with language versions is non-negotiable.

3. SQL refresher challenges with stored procedures I had used basic SELECT/JOIN queries in college but never written a stored procedure. I practised converting common business queries into procedures with parameters and gradually understood why procedures matter for performance and security. The learning was that database-side logic is just as important as application-side logic in real systems.

• **What did you find novel/ exciting / valuable during this period?**

The most exciting moment was the leadership-connect session with a Senior Director from the ADM Practice — hearing first-hand how Cognizant delivers full-stack engagements to global banks made the upcoming training feel directly relevant. The transition from a college student to a GenC trainee with an active Cognizant ID was also genuinely memorable.

• **What process(es) / system(s) did you familiarize yourself with / study as part of your work or out of your interest?**

I familiarized myself with the GenC Learn platform, MyCognizant portal, internal collaboration tools, and the structured Cognizant onboarding workflow. Out of personal interest, I read about Cognizant's ADM service line,

Department of Computer Science and Engineering

the differences between application development and application maintenance engagements, and how PoD-based delivery models work.

- If you have seen anything where an improvement is possible/ required, pl mention / describe that here.

The volume of mandatory e-learning in the first week was difficult to balance against the start of technical refresher modules. Slightly spreading the e-learning across the first two weeks rather than front-loading it would reduce cognitive overload. A short Day-1 walkthrough of the GenC Learn UI itself would also help new trainees navigate the platform faster.

- You have seen and handled / worked on many things / aspects in this period. What according to you, can be of use to your institute and students and in what ways?

The structured onboarding approach — mapping every policy, tool, and cultural value to a Day-1 to Day-7 plan — could be adapted to YCCE's induction for first-year and final-year students. The behavioural pre-assessment format (structured group discussion with peer feedback) could be incorporated into the Soft Skills lab. Introducing students to a 'corporate-style' learning platform during the final-year project could also smoothen their transition into industry.

- Have you been able to complete everything that you had planned last fortnight?

Yes, all bootcamp activities, mandatory e-learning, BH pre-assessment, and Sprint 0 self-paced modules scheduled for this fortnight were completed within the timeline. There are no pending deliverables.

STUDENT'S DIARY/ LOG

Your Name: Adarsh Kishor Satpute

Your Institute: Yeshwantrao Chavan College of Engineering

Company where internships are carried out: Cognizant Technology Solutions India Pvt. Ltd.

Period : 2 weeks From : 10-03-2026 To : 23-03-2026

Week: 3-4		Date:	From : 10-03-2026 To : 23-03-2026
Dept./Division	GenC ADM Java FSE React	Name of Project	Sprint 1 – Project Setup, Agile, DSA
Name of Supervisor With e-mail id		Mrs. Maria Ashwini Email: maria.ashwini@cognizant.com	
Main points of the week		Agile Methodology, Jira Basics, Git Basics, Data Structures and Algorithms	
From 10th to 16th March 2026, Sprint 1 of the ADM Java FSE – React (Stage 2 Plus) program commenced with formal Sprint Planning under the DevLed Skilling methodology. The first half of the fortnight focused on Agile Methodology, the Scrum framework, Agile estimation (Story Points, Planning Poker), writing effective User Stories with acceptance criteria, and Agile metrics such as Velocity and Burndown Charts. Jira Basics covered creating projects, managing issues (Story, Task, Bug, Epic), Scrum boards, sprint planning, workflows, and built-in Agile reports. Embedded AI features such as Atlassian Intelligence and Rovo were also explored. From 17th to 23rd March 2026, Git Basics and Data Structures and Algorithms (DSA) were the focus areas. Git fundamentals — repositories, the working directory, staging area, commits, branching, merging, and conflict resolution — were practised through hands-on PoD-based exercises. Branching strategies including Feature Branching and Git Flow, along with Forking and Pull Request workflows on GitHub, were applied during pair programming. The DSA module covered Big O notation, arrays, strings, linked lists, stacks, queues, recursion, sorting and searching algorithms, and an introduction to Greedy and Dynamic Programming, with HackerRank practice problems solved daily.

Department of Computer Science and Engineering

• Who did you interact with in this period? Which depts. did you visit / work in?

I continued within the GenC ADM Java FSE React PoD with Mr. Vinod Krishnaswamy as the lead trainer. I collaborated with PoD members during Sprint Planning, Daily Stand-ups, and a Sprint Retrospective. A virtual session with a Cognizant ADM Architect on real-world Scrum delivery was also conducted during this fortnight.

• List down (maximum) three activities carried out by you in this period. Describe each one briefly.

Activity 1 — Sprint 1 Planning & Scrum Ceremonies (Days 1–3)

Participated in formal Sprint Planning where the PoD was given a Product Backlog for the Capstone Integrated Development Project (IDP). User stories were estimated using Planning Poker, prioritised, and committed to. Daily Stand-ups began the same week with strict 15-minute timeboxes, and the cadence has continued throughout the program.

Activity 2 — Jira Hands-On Lab (Days 4–6)

Created a Jira project for the Capstone IDP, configured a Scrum board, defined Epics, Stories, Tasks, and Sub-tasks, and tracked sprint progress through built-in Burndown and Velocity reports. Workflow customization, labels, and components were applied to organise work effectively. Atlassian Intelligence was used to draft initial story descriptions for refinement.

Activity 3 — Git Branching, Pull Requests & DSA Practice (Days 7–11)

Practised feature-branch workflows with pull requests, peer code reviews, and merge-conflict resolution within the PoD repository. In parallel, solved HackerRank DSA problems on arrays, linked lists, stacks, queues, recursion, and classical sorting algorithms, with daily timed practice sets to build coding fluency for assessments ahead.

• What problems did you face and what did you do to address them? What was the learning that resulted from each of them?

1. Estimating story points realistically My initial story-point estimates were either too optimistic or too pessimistic relative to actual completion time. The PoD's Sprint Retrospective surfaced this, and I started anchoring estimates against a known reference story. The learning was that Agile estimation is calibrated through experience, not calculation.

2. Resolving Git merge conflicts cleanly My first real merge conflict on a feature branch produced files with conflict markers I did not initially understand. The trainer walked us through resolving conflicts in the IDE, choosing between current and incoming changes, and verifying with git status. The learning: small, frequent commits and rebasing on main reduce conflict pain dramatically.

E-mail : principal@ycce.edu, info@ycce.edu

Department of Computer Science and Engineering

3. Translating DSA problems into clean Java code On HackerRank I could often see the algorithmic approach but struggled to translate it into idiomatic Java with correct edge-case handling. I started writing a brief problem-restatement and pseudocode before coding, and my submission accuracy improved noticeably. Precision matters even more than speed in technical assessments.

• What did you find novel/ exciting / valuable during this period?

The most exciting moment was running the first real Daily Stand-up where each PoD member shared progress, blockers, and the day's commitment in 60 seconds — Agile suddenly felt like a real working pattern, not a textbook concept. Successfully merging my first pull request after a peer code review was equally satisfying.

• What process(es) / system(s) did you familiarize yourself with / study as part of your work or out of your interest?

I familiarized myself with the full Scrum lifecycle (Sprint Planning, Daily Stand-up, Sprint Review, Sprint Retrospective), the Jira workflow engine, and Git branching strategies. Out of personal interest, I read about how distributed teams scale Agile using SAFe and LeSS, and how trunk-based development differs from Git Flow.

• If you have seen anything where an improvement is possible/ required, pl mention / describe that here.

The DSA module was paced for participants with prior competitive programming exposure. A short pre-assessment to stream learners by DSA proficiency would let stronger learners go deeper while giving newcomers more structured fundamentals practice. A daily 30-minute DSA recap session — even informal — would also help retention.

• You have seen and handled / worked on many things / aspects in this period. What according to you, can be of use to your institute and students and in what ways?

The Scrum-based PoD structure could replace traditional final-year project teams at YCCE — assigning each team a Product Owner, Scrum Master, and Developers, running real sprints with Jira, and evaluating retrospective quality. Git workflow practice (feature branching, pull requests, code reviews) should be a standalone Software Engineering lab rather than left for students to pick up informally.

Your Name: Adarsh Kishor Satpute

Your Institute: Yeshwantrao Chavan College of Engineering

Company where internships are carried out: Cognizant Technology Solutions India Pvt. Ltd.

Period : 2 weeks From : 24-03-2026 To : 06-04-2026

Week: 5-6		Date:	From : 24-03-2026 To : 06-04-2026
Dept./Division	GenC ADM Java FSE React	Name of Project	Sprint 1 – Backend & Data Foundations
Name of Supervisor With e-mail id		Mr. Maria Ashwini Email: maria.ashwini@cognizant.com	
Main points of the week		Design Patterns and Principles, Spring Core, Maven, Spring Data JPA with Hibernate	
From 24th to 30th March 2026, the Design Patterns and Principles module strengthened my understanding of clean code and object-oriented design. SOLID principles, DRY, KISS, YAGNI, and the trade-offs between Coupling and Cohesion were studied with Java examples. Classical Gang of Four design patterns were practised across creational (Singleton, Factory, Builder), structural (Adapter, Decorator, Proxy, Facade), and behavioural categories (Strategy, Observer, Command, Template Method, State). Refactoring exercises and identifying anti-patterns such as God Object and Spaghetti Code were also performed. From 31st March to 6th April 2026, Spring Core, Maven, and Spring Data JPA with Hibernate formed the core of backend training. The Spring IoC container, Inversion of Control, and Dependency Injection were practised through both XML and annotation-based configurations. Maven was used for project setup, dependency management, and lifecycle goals. Spring Data JPA with Hibernate was applied to MySQL, where I created entities with @Entity, @Table, @Id, @GeneratedValue, mapped relationships (@OneToMany, @ManyToOne), and implemented repository methods with derived queries, @Query JPQL, pagination, and sorting.

Department of Computer Science and Engineering

• Who did you interact with in this period? Which depts. did you visit / work in?

I continued within the GenC ADM Java FSE React PoD with Mr. Vinod Krishnaswamy as the trainer. I collaborated with PoD members on the Capstone IDP backend, which started taking shape during Sprint 1. A guest virtual session by a Cognizant Senior Architect on enterprise Java backend design was conducted during this period.

• List down (maximum) three activities carried out by you in this period. Describe each one briefly.

Activity 1 — SOLID Refactoring Workshop (Days 1–3)

Given a deliberately badly-designed Java service violating multiple SOLID principles, the PoD refactored it in stages — extracting interfaces, applying the Strategy pattern, and removing tight coupling. Each refactor was reviewed against the original and documented as a 'before / after' diff with reasoning, mirroring how design reviews work on real projects.

Activity 2 — Spring Core IoC and DI Hands-On (Days 4–7)

Built a Spring Core application from scratch using Maven, then progressively converted XML-based bean configuration to annotation-based and finally to Java-config (`@Configuration`, `@Bean`). Constructor injection, setter injection, `@Autowired`, `@Qualifier`, and component scanning were all practised. AOP aspects were added for cross-cutting logging concerns.

Activity 3 — Spring Data JPA + Hibernate with MySQL (Days 8–11)

Bootstrapped a Spring Boot project and configured it to connect to a MySQL instance. Defined entities for the Capstone IDP domain, modelled `@OneToMany` and `@ManyToOne` relationships, wrote repository interfaces extending `JpaRepository`, and tested CRUD operations through Spring Boot's auto-wired test setup. Pagination, sorting, and JPQL `@Query` examples were built in.

• What problems did you face and what did you do to address them? What was the learning that resulted from each of them?

1. Over-engineering with design patterns After learning patterns, I applied them everywhere — including places where simple methods would suffice. The trainer flagged a Strategy pattern I had used for a single conditional branch. The learning: patterns solve specific problems, and applying them without need is itself an anti-pattern (Golden Hammer).

2. Circular dependencies in Spring DI Two of my `@Service` beans accidentally referenced each other, producing a circular-dependency exception at startup. I refactored one of them to inject the other lazily using `@Lazy`.

E-mail : principal@ycce.edu, info@ycce.edu

Department of Computer Science and Engineering

3. JPA lazy-loading exceptions outside transactions When I tried to access a lazily-loaded collection outside a @Transactional boundary, I hit a LazyInitializationException. I fixed it by either using a fetch join in the repository query or restructuring the service layer to keep the access inside a transaction. The learning: the persistence context is tied to the transaction, and silent assumptions break in production.

• **What did you find novel/ exciting / valuable during this period?**

The most satisfying moment was watching Spring's IoC container wire up an entire object graph at startup based on @Autowired annotations alone — the dependency-injection magic finally made intuitive sense. Successfully running the first real CRUD operation against MySQL through Spring Data JPA without writing a single SQL statement was equally exciting.

• **What process(es) / system(s) did you familiarize yourself with / study as part of your work or out of your interest?**

I familiarized myself with Maven's lifecycle phases (compile, test, package, install), Spring's bean lifecycle and scopes, the application context, and Spring Data JPA's repository abstraction. Out of personal interest, I read about how Hibernate's first-level and second-level caches interact, and how Hibernate generates SQL behind the scenes.

• **If you have seen anything where an improvement is possible/ required, pl mention / describe that here.**

The transition from Spring Core to Spring Boot felt slightly rushed — Spring Boot's auto-configuration was introduced almost as a side-effect rather than as a deliberate progression. A short dedicated session contrasting traditional Spring + XML with Spring Boot's opinionated defaults would help learners appreciate what auto-configuration actually saves them.

• **You have seen and handled / worked on many things / aspects in this period. What according to you, can be of use to your institute and students and in what ways?**

Teaching design patterns through refactoring a deliberately broken codebase — rather than presenting them as standalone abstract examples — is far more impactful and could be adopted directly in YCCE's Software Engineering lab. Spring Boot + JPA can be introduced in the final-year Web Technologies course as the natural successor to JDBC, which would significantly close the college-to-industry gap.

Period : 2 weeks From : : 07-04-2026 To : 20-04-2026

Week: 7-8		Date:	From : 07-04-2026 To : 20-04-2026
Dept./Division	GenC ADM Java FSE React	Name of Project	Sprint 2 – API Development & Testing
Name of Supervisor With e-mail id		Mrs. Maria Ashwini Email: maria.ashwini@cognizant.com	
Main points of the week		Spring REST with Spring Boot 3, Backend Debugging, TDD with JUnit 5 & Mockito, SLF4J & Lombok	
From 7th to 13th April 2026, Sprint 2 commenced with a focus on RESTful API development using Spring REST with Spring Boot 3. Concepts covered included REST architecture, HTTP methods, status codes, statelessness, and Spring Boot 3-specific features. Hands-on exercises involved building @RestController classes, defining endpoints with @GetMapping, @PostMapping, @PutMapping, and @DeleteMapping, using @PathVariable and @RequestParam, and processing JSON requests/responses through DTOs and Jackson. Validation was applied using @Valid and Bean Validation annotations. Global exception handling was implemented through @ControllerAdvice and @ExceptionHandler. APIs were tested using Postman and documented with Swagger / Springdoc OpenAPI. From 14th to 20th April 2026, the focus shifted to Backend Application Debugging, Test-Driven Development using JUnit 5 and Mockito, and structured logging with SLF4J and Lombok. IntelliJ IDEA's debugger was used systematically — breakpoints, watches, conditional breakpoints, and stepping through asynchronous code. JUnit 5 tests were written using TDD's Red-Green-Refactor cycle, with Mockito for mocking dependencies

Department of Computer Science and Engineering

• Who did you interact with in this period? Which depts. did you visit / work in?

I continued within the GenC ADM Java FSE React PoD with Mr. Vinod Krishnaswamy as the trainer. I collaborated with PoD members on the Capstone IDP backend APIs and unit tests. The Interim Evaluation was conducted at the end of this fortnight, involving a one-on-one technical and project review session with a Cognizant BU Subject Matter Expert.

• List down (maximum) three activities carried out by you in this period. Describe each one briefly.

Activity 1 — Building REST APIs with Spring Boot 3 (Days 1–4)

Implemented full CRUD REST APIs for the Capstone IDP domain using `@RestController`. DTOs were used to decouple persistence entities from API contracts, with explicit mapping logic. Validation was applied through Bean Validation annotations on DTOs, and a global `@ControllerAdvice` handler returned consistent JSON error responses. APIs were tested in Postman and documented through Springdoc-generated OpenAPI 3 specifications.

Activity 2 — TDD with JUnit 5 and Mockito (Days 5–8)

Practised the Red-Green-Refactor cycle by writing failing unit tests first, implementing minimal code to pass, then refactoring. Mockito was used to mock repository and external service dependencies in service-layer tests. Spring Boot's `@WebMvcTest` with `MockMvc` was used for controller tests, and `@DataJpaTest` with an in-memory H2 database for repository tests. Test coverage was measured and improved iteratively.

Activity 3 — SLF4J Logging, Lombok, and Interim Evaluation (Days 9–11)

Configured Logback with structured JSON logging for the IDP backend, applied appropriate log levels (TRACE, DEBUG, INFO, WARN, ERROR), and added contextual MDC values for traceability. Lombok annotations significantly reduced entity and DTO boilerplate. The fortnight concluded with the Interim Evaluation — a one-on-one technical interview and IDP walkthrough with a Cognizant BU SME, evaluating Sprint 1 and Sprint 2 competencies on the RAG scale.

• What problems did you face and what did you do to address them? What was the learning that resulted from each of them?

1. Returning consistent error responses across endpoints Initially, each controller handled exceptions individually, producing inconsistent JSON shapes for clients. Centralising exception handling in a single `@ControllerAdvice` with a structured `ApiError` class fixed it. The learning: API consumers value contract consistency far more than per-endpoint cleverness.

2. Writing tests that were too tightly coupled to implementation My early Mockito tests verified internal call sequences so strictly that any refactor broke them. The trainer pointed out that I was testing implementation, not

E-mail : principal@ycce.edu, info@ycce.edu

Department of Computer Science and Engineering

behaviour. Rewriting the tests to assert outputs and observable side-effects made them resilient. Tests should describe what code does, not how.

3. Interim Evaluation pressure on system design questions In the Interim Evaluation, I was asked to justify my choice of layering (Controller-Service-Repository), DTO usage, and how I would scale the system. Initially nervous, I structured my answer around responsibility separation and trade-offs. The learning: technical interviews reward structured reasoning and trade-off awareness, not memorised answers.

• **What did you find novel/ exciting / valuable during this period?**

The most exciting moment was watching the entire CRUD flow work end-to-end — a Postman POST hitting the controller, validation succeeding, the service persisting via JPA, and the response coming back with correct HTTP semantics — all observable through structured SLF4J logs. Passing the Interim Evaluation with a Green PHS rating was a significant personal milestone.

• **What process(es) / system(s) did you familiarize yourself with / study as part of your work or out of your interest?**

I familiarized myself with Spring Boot's auto-configuration internals, the Servlet vs Reactive stacks, Springdoc's OpenAPI generation pipeline, and Spring Boot's testing slices. Out of personal interest, I read about contract testing, Pact, and how teams maintain backwards compatibility across API versions in real microservices.

• **If you have seen anything where an improvement is possible/ required, pl mention / describe that here.**

The Interim Evaluation focused heavily on conceptual depth, but mock interview practice in the days leading up to it was minimal. Adding two structured peer-led mock interviews per week in the run-up to the evaluation would substantially improve readiness. Documentation generation with Springdoc could also have a fuller hands-on session.

• **You have seen and handled / worked on many things / aspects in this period. What according to you, can be of use to your institute and students and in what ways?**

TDD discipline — writing failing tests first — should be introduced early in a college Software Engineering lab rather than as an optional advanced topic. Building one small REST API with full Postman-driven testing and Springdoc documentation would teach final-year students more about real-world backend than several semesters of theory. Lombok and structured logging are also concrete productivity improvements students benefit from immediately.

STUDENT'S DIARY/ LOG

Your Name: Adarsh Kishor Satpute

Your Institute: Yeshwantrao Chavan College of Engineering

Company where internships are carried out: Cognizant Technology Solutions India Pvt. Ltd.

Period : 2 weeks From : : 21-04-2026 To : 04-05-2026

Week: 9-10 (in progress)		Date:	From : 21-04-2026 To : 04-05-2026
Dept./Division	GenC ADM Java FSE React	Name of Project	Sprint 3 – Microservices & Containerization
Name of Supervisor With e-mail id		Mrs. Maria Ashwini Email: maria.ashwini @cognizant.com	
Main points of the week		Microservices with Spring Boot 3 & Spring Cloud, Docker, GitHub Copilot	
From 21st to 27th April 2026, Sprint 3 began with a deep dive into microservices architecture. The differences between monolithic and microservices architectures, advantages, challenges, and characteristic patterns were studied. Spring Cloud components were applied: service discovery and registration with Spring Cloud Netflix Eureka, externalised configuration with Spring Cloud Config, declarative inter-service communication with Spring Cloud OpenFeign, and API Gateway routing with Spring Cloud Gateway. Resilience patterns — Circuit Breaker, fallback, and retry — were implemented using Resilience4j. Centralised authentication using OAuth 2.1 / OIDC with JWT tokens was introduced for securing inter-service communication. The remainder of this fortnight (28th April onwards, currently in progress) is dedicated to Docker containerization and GitHub Copilot. Docker fundamentals — containers vs virtual machines, images, registries — are being covered through hands-on Dockerfile authoring, image building, and running multi-container applications with Docker Compose. The Capstone IDP services are progressively being containerized along with their MySQL backing store. GitHub Copilot is being integrated into the IDE for AI-assisted coding, with parallel sessions on Responsible AI usage, prompt engineering best practices, and the licensing and review discipline required when using AI-generated code.

Department of Computer Science and Engineering

• Who did you interact with in this period? Which depts. did you visit / work in?

I am continuing within the GenC ADM Java FSE React PoD with Mr. Vinod Krishnaswamy as the trainer. PoD collaboration has intensified during Sprint 3 because microservices decomposition of the Capstone IDP requires closer coordination on API contracts. A virtual session by a Cognizant Cloud Architect on real-world microservices delivery is scheduled later in the fortnight.

• List down (maximum) three activities carried out by you in this period. Describe each one briefly.

Activity 1 — Microservices Decomposition with Spring Cloud (Days 1–4)

The Capstone IDP monolith was decomposed into multiple Spring Boot microservices, each owning a bounded context. A Eureka discovery server, a Spring Cloud Config server, and a Spring Cloud Gateway were stood up. OpenFeign clients were used for inter-service calls, with Resilience4j Circuit Breaker wrapping all outbound dependencies. Centralised JWT-based authentication was wired through the gateway.

Activity 2 — Dockerizing Services with Docker Compose (Days 5–7, in progress)

Each microservice received a multi-stage Dockerfile (build stage with Maven, runtime stage with a slim JRE base). A docker-compose.yml file orchestrates the gateway, Eureka, config server, business services, and a MySQL container with persistent volumes. Inter-container networking and environment-variable-based configuration were configured for portability across local and cloud environments.

Activity 3 — GitHub Copilot Integration & Responsible Usage (Days 8 onwards, in progress)

GitHub Copilot is being integrated into IntelliJ IDEA for context-aware code suggestions, boilerplate generation, and unit-test scaffolding. Parallel sessions cover prompt engineering — phrasing requests precisely to get useful suggestions — alongside Cognizant's Responsible AI principles, licensing/attribution policies, and the discipline of reviewing every AI-generated suggestion before accepting it.

• What problems did you face and what did you do to address them? What was the learning that resulted from each of them?

1. Designing service boundaries correctly My initial decomposition produced services that shared too much data, leading to chatty inter-service calls. Re-examining the bounded contexts and merging two services that always changed together produced a much cleaner architecture. The learning was that microservices boundaries follow business capabilities, not technical layers.

2. Debugging across multiple containers When a request failed somewhere in the chain (gateway → service A → service B), tracing the failure was significantly harder than in a monolith. I started using correlation IDs propagated

Yeshwantrao Chavan College of Engineering

(An Autonomous Institution affiliated to Rashtrasant Tukadoji Maharaj Nagpur University)

(Accredited 'A' Grade by NAAC)

Hingna Road, Wanadongri, Nagpur - 441 110

Ph.: 07104-242919, 242623, Fax: 07104-242376, Website: www.ycce.edu

E-mail : principal@ycce.edu, info@ycce.edu

Department of Computer Science and Engineering

via SLF4J MDC and aggregated logs with docker logs --tail. The deeper learning is that distributed systems require distributed tracing as a first-class concern, not an afterthought.

3. Calibrating GitHub Copilot suggestions Copilot's first suggestions for non-trivial business logic were sometimes plausible-looking but subtly wrong. Reviewing each suggestion line-by-line — and rejecting confidently — became a discipline. The learning: AI assistance is a productivity multiplier only if you remain the engineer of record; treating its output as automatically correct is a fast path to defects.

• **What did you find novel/ exciting / valuable during this period?**

The most exciting moment was watching the entire microservices stack come up via a single docker-compose up — the gateway, Eureka, config server, multiple Spring Boot services, and MySQL all started, registered, and began serving requests as a coherent system. Seeing GitHub Copilot scaffold a passable JUnit test class from a service-method signature was also genuinely impressive, with the necessary caveats around review.

• **What process(es) / system(s) did you familiarize yourself with / study as part of your work or out of your interest?**

I am familiarizing myself with Spring Cloud's component ecosystem (Eureka, Config Server, Gateway, OpenFeign, Resilience4j), Docker Compose orchestration, and Cognizant's GenAI usage policies for client engagements. Out of personal interest, I am reading about service mesh technologies (Istio, Linkerd) and how they provide observability and security at the network layer rather than in application code.

• **If you have seen anything where an improvement is possible/ required, pl mention / describe that here.**

Distributed tracing (Spring Cloud Sleuth / Zipkin) is touched on briefly but deserves a fuller hands-on session given how essential it is for real-world microservices debugging. A short practical lab on adding correlation IDs and visualising a multi-service request trace would significantly reinforce the value of observability in distributed systems.

• **You have seen and handled / worked on many things / aspects in this period. What according to you, can be of use to your institute and students and in what ways?**

Microservices need not be reserved for industry training — even a small final-year project decomposed into two or three Spring Boot services orchestrated by Docker Compose would teach final-year students far more about real-world architecture than monolithic implementations. AI-assisted coding combined with mandatory review discipline is also a skill students should learn under guidance, not pick up unsupervised.

- Have you been able to complete everything that you had planned last fortnight?

Microservices decomposition, Spring Cloud components, and the initial Dockerization of services have been completed. Docker Compose orchestration of the full stack and the GitHub Copilot integration are in progress as planned for the second half of this fortnight. There are no slipped deliverables; activities scheduled for completion later in this fortnight remain on track.

Provided me with contacts which may lead to future employment	Strongly Agree				
Allowed me to acquire information and/or use equipment not available at my Institute	Strongly Agree				

● **In the Institute internship program, faculty members are expected to be mentors for students. Do you feel that your faculty coordinator served such a function? Why or why not?**

Yes, the faculty coordinator effectively served as a mentor throughout the internship. They provided consistent guidance, clarified doubts during review sessions, and ensured that learning objectives remained aligned with industry expectations. Their availability during evaluations and structured feedback sessions made it easier to navigate complex topics, calibrate against the GenC PHS framework, and maintain motivation throughout the program.

● **How well were you able to accomplish the initial goals, tasks and new skills that were set down in your learning contract? In what ways were you able to take a new direction or expand beyond your contract? Why were some goals not accomplished adequately?**

Most of the goals defined in the learning contract were successfully achieved. I gained a strong understanding of Agile methodologies, Spring Boot 3 backend development, RESTful API design, Spring Data JPA with Hibernate, JUnit 5 with Mockito-based TDD, microservices architecture using Spring Cloud, Docker containerization, and modern frontend development with React (v18), TypeScript, and Bootstrap 5. I expanded beyond the initial scope by exploring distributed tracing, AWS deployment patterns (EC2, S3, RDS, Elastic Beanstalk, CodePipeline), SonarQube static analysis integration, and Responsible AI usage with GitHub Copilot. Some advanced microservices patterns such as event-driven communication via Kafka could not be explored in complete depth due to the broad scope of the curriculum.

E-mail : principal@ycce.edu, info@ycce.edu

Department of Computer Science and Engineering

● In what areas did you most develop and improve?

I experienced significant growth in both technical and professional areas. Technically, I improved substantially in Spring Boot backend development, Spring Data JPA modelling, REST API design, TDD discipline with JUnit and Mockito, microservices decomposition with Spring Cloud, Docker-based deployment, and React-based frontend engineering. My problem-solving ability, debugging skills using IntelliJ IDEA and Chrome DevTools, and understanding of distributed system architecture also improved markedly. Professionally, my structured communication, agile collaboration, ability to work in a PoD, and confidence in BU SME evaluations developed considerably through continuous interaction and structured feedback.

● What has been the most significant accomplishment or satisfying moment of your internship?

The most satisfying achievement was successfully passing the Interim Evaluation with a Green PHS rating after a one-on-one technical and project review with a Cognizant BU Subject Matter Expert. Equally significant was watching the Capstone Integrated Development Project come together end-to-end — a React frontend consuming Spring Boot REST APIs that orchestrate multiple microservices behind a Spring Cloud Gateway, with MySQL persistence, all containerized with Docker Compose. Seeing a request flow through every layer I had built was a major confidence-building milestone.

● What did you dislike about the internship?

The main challenge was the fast pace of the DevLed Skilling structure, which required absorbing multiple complex technologies within tight sprint timeboxes. While this provided broad and realistic exposure, it sometimes limited the opportunity to explore individual topics in deep technical depth — particularly distributed tracing and advanced Spring Cloud resilience patterns. Balancing self-paced learning, classroom sessions, hands-on exercises, the Capstone IDP, and BU SME evaluations simultaneously was demanding at times.

● Considering your overall experience, how would you rate this internship? (Circle one). (Satisfactory/ Good/ Excellent)

Excellent

● Give suggestions as to how your internship experience could have been improved.

The internship experience was highly valuable, but it could be further improved by allocating slightly more dedicated time for deeper hands-on practice in areas like microservices observability (distributed tracing, log aggregation) and AWS DevOps pipeline construction. Adding two structured peer-led mock interviews per week leading up to the Interim and Final Evaluations would also build evaluation confidence. Overall, the program structure and mentorship quality were strong.

Overall performance of student intern (circle one):

(Needs improvement / Satisfactory / Good / Excellent)

Additional comments, if any:

Adarsh has demonstrated strong technical aptitude across the Java Full Stack curriculum, consistently delivering high-quality work in Spring Boot, JPA, microservices, and React. He passed the Interim Evaluation with a Green PHS rating and contributes actively to PoD-based agile delivery. Recommended for deployment readiness post Sprint 5 Final Evaluation.
